

# FILE-RITE™

## Canal Lubricant and Chelating Agent

- 4 x 5 gm syringes File-Rite
- 50 applicator tips
- Instructions for Use
- MSDS

**CAUTION:** Federal law restricts this device to sale by or on the order of a dentist.  
STORE IN COOL, DRY PLACE.

MADE IN USA

File-Rite is a 17% EDTA gel that has been buffered to a neutral pH. During instrumentation and debridement of the root canal, File-Rite is an effective calcium binding material for chelating and removing dentin from the canal walls, and it acts as a lubricant to minimize the binding and breaking of files.

### Directions for Use

1. Always place a rubber dam.
2. Remove cap from the syringe and place an applicator needle securely on the syringe.
3. Dispense File-Rite directly into the canal. For controlled dispensing, hold syringe barrel with fingertips, place plunger in palm, and gently pull back with fingers. File-Rite can also be placed directly on the file or into a dampen dish.
4. Instrument the canal. Reapply File-Rite and repeat as necessary until the canal is enlarged and shaped as desired.
5. Rinse canal thoroughly.
6. Discard needle and place cap back on the syringe. Use a new needle for each patient.
